FREE HANGING UNDUCTED AIR CLEANING SYSTEMS

Unducted air cleaning systems consist of one or more interior air cleaners positioned in the overhead plant space to create a planned air circulation airflow pattern.

This method effectively cleans the overall ambient air. Unducted systems rely on constant cleaning and mixing of the entire area volume to remove contaminants. Unducted systems never remove 100% of the contaminants.

The objective of this method is to achieve a substantial contaminant reduction at steady-state levels. Unducted systems will typically provide an estimated 65 to 85% contaminant reduction. The percentage reduction is based on the number of air changes provided by the unducted air cleaning system.
